SUBJECT INDEX

Acoustic processing by coherent optical techniques, recent progress in, 121
Adaptive processing, batch covariance relaxation (BCR), 165
Advanced onboard signal processors for satellite communication systems, 225
Algorithm, computation of minimum eigenvalue of Toeplitz matrix by Levinson, 40
Algorithm, and architectures for real-time signal processing, parallel processing, 2
Analog devices, video compression using sampled data, 142
Analog information processing, neural, 138
Antijam communications chipset and brassboard demonstration, very high speed integrated circuits (VHSIC), 206
Architecture of an advanced signal processor, 92
Architecture and applications of the HEP multiprocessor computer system, 241
Architecture signal processing application, Josephson technology special purpose systolic, 59
Architectures for real-time signal processing, parallel processing algorithms and, 2
Array processor implementation, systolic, 27
Arrays, implementation of cellular, 84
Arrays for matrix computations, scattering, 74
Arrays, matrix triangularization by systolic, 19
Arrays, problem adaptation to systolic, 33
Available Multiprocessor (CHAMP) networks have great potential for signal processing, Cooperative Highly, 324

Batch covariance relaxation (BCR) adaptive processing, 165
Bit slice image processor, microprogrammable high-speed, 155
Brassboard demonstration, very high speed integrated circuits (VHSIC) antijam communications chipset and, 206

Cellular arrays, implementation of, 84
(CHAMP) networks have great potential for signal processing, Cooperative Highly Available Multiprocessor, 324
Chipset and brassboard demonstration, very high speed integrated circuits (VHSIC) antijam communications, 206
Coherent optical techniques, recent progress in acoustic processing by, 121
Combined data flow-control flow processor, motivation for a, 305
Communication systems, advanced onboard signal processors for satellite, 225
Communications chipset and brassboard demonstration, very high speed integrated circuits (VHSIC) antijam, 206
Communications and control medium, experimental distributed microprocessor implementation with a shared memory, 233
Components: a comprehensive approach to signal processing, programmable systems, 198
Compression using sampled data analog devices, video, 142
Compression standard, military data, 268
Computation of minimum eigenvalue of Toeplitz matrix by Levinson algorithm, 40
Computations, scattering arrays for matrix, 74
Computer configuration, real-time image, 150
Computer system, architecture and applications of the HEP multiprocessor, 241
Computing, the software-implemented fault tolerance (SIFT) approach to fault tolerant, 289
Configuration, real-time image computer, 150
Considerations for real-time processing in a local area network, 249
Control flow processor, motivation for a combined data flow-, 305
Control medium, experimental distributed microprocessor implementation with a shared memory communications and, 233
Controlling system with real-time signal processing, plasma analyzing and, 189
Cooperative Highly Available Multiprocessor (CHAMP) networks have great potential for signal processing, 324
Covariance relaxation (BCR) adaptive processing, batch, 165
Cryogenic frequency domain optical mass memory, 107

Data analog devices, video compression using sampled, 142
Data compression standard, military, 268
Data flow-control flow processor, motivation for a combined, 305
Data processing: a look at the problems of throughput and reliability, multicomputer systems in real-time sensor, 294
Design for real-time image processing, digital pipelined hardware median filter, 184
Detection, parallel signal processing for optical satellite, 173
Digital pipelined hardware median filter design for real-time image processing, 184
Distributed microprocessor implementation with a shared memory communications and control medium, experimental, 233
Distributed processing system, a militarized, 257
Distributed signal processing, real-time modular, 312
Dynamic spatial filter for optical signal processing using a liquid crystal light valve, 115

Eigenvalue of Toeplitz matrix by Levinson algorithm, computation of minimum, 40
Experimental distributed microprocessor implementation with a shared memory communications and control medium, 233

Fault tolerance (SIFT) approach to fault tolerant computing, the software-implemented, 289
Fault tolerant computing, the software-implemented fault tolerance (SIFT) approach to, 289
Filter design for real-time image processing, digital pipelined hardware median, 184
Filter for optical signal processing using a liquid crystal light valve, dynamic spatial, 115
Flow-control flow processor, motivation for a combined data, 305
Flow processor, motivation for a combined data flow-control, 305

Hardware median filter design for real-time image processing, digital pipelined, 184
HEP multiprocessor computer system, architecture and applications of the, 241
High speed bit slice image processor, microprogrammable, 155
High speed integrated circuits (VHSIC) antijam communications chipset and brassboard demonstration, very, 206

Image computer configuration, real-time, 150
Image processing, digital pipelined hardware median filter design for real-time, 184
Image processor, microprogrammable high-speed bit slice, 155
Implementation of cellular arrays, 84
Information processing, neural analog, 138
Integrated circuits (VHSIC) antijam communications chipset and brassboard demonstration, very high speed, 206
Integration (VLSI) approach to real-time computation problems, very large scale, 48
Integration based, signal processor—its application and possible evolution, a large scale, 128

Josephson technology special purpose systolic architecture signal processing application, 59

Large scale integration (VLSI) approach to real-time computation problems, very, 48
Large scale integration based, signal processor—its application and possible evolution, a, 128
Levinson algorithm, computation of minimum eigenvalue of Toeplitz matrix by, 40
Light valve, dynamic spatial filter for optical signal processing using a liquid crystal, 115
Liquid crystal light valve, dynamic spatial filter for optical signal processing using a, 115
Local area network, considerations for real-time processing in a, 249

Mass memory, cryogenic frequency domain optical, 107

Matrix computations, scattering arrays for, 74
Matrix by Levinson algorithm, computation of minimum eigenvalue of Toeplitz, 40
Matrix triangularization by systolic arrays, 19
Memory communications and control medium, experimental distributed microprocessor implementation with a shared, 233
Memory, cryogenic frequency domain optical mass, 107
Microprocessor implementation with a shared memory communications and control medium, experimental distributed, 233
Microprogrammable high-speed bit slice image processor, 155
Militarized distributed processing system, a, 257
Military data compression standard, 268
Minimum eigenvalue of Toeplitz matrix by Levinson algorithm, computation of, 40
Modular distributed signal processing, real-time, 312
Motivation for a combined data flow-control flow processor, 305
Multicomputer systems in real-time sensor data processing: a look at the problems of throughput and reliability, 294
Multiprocessor computer system, architecture and applications of the HEP, 241
Multiprocessor (CHAMP) networks have great potential for signal processing, Cooperative Highly Available, 324
Multiprocessor, real-time multiradar simulation with a, 280
Multiradar simulation with a multiprocessor, real-time, 280

Navy real-time signal processor development: second generation planned service standard, 216
Neural analog information processing, 138
New York University (NYU) ultracomputer—a general-purpose parallel processor, 64

Onboard signal processors for satellite communication systems, advanced, 225
Optical mass memory, cryogenic frequency domain, 107
Optical satellite detection, parallel signal processing for, 173
Optical signal processing using a liquid crystal light valve, dynamic spatial filter for, 115
Optical techniques, recent progress in acoustic processing by coherent, 121
Overview, signal processing technology, 102

Parallel processing algorithms and architectures for real-time signal processing, 2
Parallel signal processing for optical satellite detection, 173
Plasma analyzing and controlling system with real-time signal processing, 189
Problem adaptation to systolic arrays, 33
Processing, batch covariance relaxation (BCR) adaptive, 165
Processing, digital pipelined hardware median filter design for real-time image, 184
Processing in a local area network, considerations for real-time, 249
Processing: a look at the problems of throughput and reliability, multicomputer systems in real-time sensor data, 294
Processing, neural analog information, 138
Processing system, a militarized distributed, 257
Programmable systems components: a comprehensive approach to signal processing, 198

Real-time computation problems, very large scale integration (VLSI) approach to, 48
Real-time image computer configuration, 150
Real-time image processing, digital pipelined hardware median filter design for, 184
Real-time modular distributed signal processing, 312
Real-time multiradar simulation with a multiprocessor, 280
Real-time processing in a local area network, considerations for, 249
Real-time sensor data processing: a look at the problems of throughput and reliability, multicomputer systems in, 294
Real-time signal processing, parallel processing algorithms and architectures for, 2
Real-time signal processing, plasma analyzing and controlling system with, 189
Real-time signal processor development: second generation planned service standard, navy, 216
Recent progress in acoustic processing by coherent optical techniques, 121
Relaxation (BCR) adaptive processing, batch covariance, 165
Reliability, multicomputer systems in real-time sensor data processing: a look at the problems of throughput and, 294

Satellite communication systems, advanced onboard signal processors for, 225
Satellite detection, parallel signal processing for optical, 173
Scattering arrays for matrix computations, 74
Second generation planned service standard, navy real-time signal processor development:, 216
Sensor data processing: a look at the problems of throughput and reliability, multicomputer systems in real-time, 294
Service standard, navy real-time signal processor development: second generation planned, 216
Shared memory communications and control medium, experimental distributed microprocessor implementation with a, 233
Signal processing application, Josephson technology special purpose systolic architecture, 59
Signal processing, Cooperative Highly Available Multiprocessor (CHAMP) networks have great potential for, 324
Signal processing using a liquid crystal light valve, dynamic spatial filter for optical, 115
Signal processing for optical satellite detection, parallel, 173
Signal processing, parallel processing algorithms and architectures for real-time, 2
Signal processing, plasma analyzing and controlling system with real-time, 189
Signal processing, programmable systems components: a comprehensive approach to, 198
Signal processing, real-time modular distributed, 312
Signal processing technology overview, 102
Signal processor—its application and possible evolution, a large scale integration based, 128
Signal processor, architecture of an advanced, 92
Signal processor development: second generation planned service standard, navy real-time, 216
Signal processors for satellite communication systems, advanced onboard, 225
Simulation with a multiprocessor, real-time multiradar, 280
Software-implemented fault tolerance (SIFT) approach to fault tolerant computing, 289
Spatial filter for optical signal processing using a liquid crystal light valve, dynamic, 115
Standard, military data compression, 268
Standard, navy real-time signal processor development: second generation planned service, 216
Systolic architecture signal processing application Josephson technology special purpose, 59
Systolic array processor implementation, 27
Systolic arrays, matrix triangularization by, 19
Systolic arrays, problem adaptation to, 33
Systolic processor, 200 million operations per second (MOPS), 10

Throughput and reliability, multicomputer systems in real-time sensor data processing: a look at the problems of, 294
Toeplitz matrix by Levinson algorithm, computation of minimum eigenvalue of, 40
Tolerance (SIFT) approach to fault tolerant computing, the software-implemented fault, 289
Tolerant computing, the software-implemented fault tolerance (SIFT) approach to fault, 289
Triangularization by systolic arrays, matrix, 19
200 million operations per second (MOPS) systolic processor, 10

Very high speed integrated circuits (VHSIC) antijam communications chipset and brassboard demonstration, 206
Very large scale integration (VLSI) approach to real-time computation problems, 48
Video compression using sampled data analog devices, 142
